GE1329 From Small Inventions to Big Successes

Ever dreamed about having the insight to become an early employee at the next Apple or Google? This course is focused on translating a basic understanding of scientific principles, balanced with social considerations, in order to recognize and evaluate how various small inventions become successful "disruptive technologies."

Dr. John Mai

brings to this course over 15 years of international product development and senior corporate management experience. He has developed hard drives for Hitachi, micro-electro-mechanical sensors for JPL/NASA, RFID tracking systems and biomedical diagnostic instruments for ITRI (Taiwan), and networked sensor-interoperability software for Cisco Systems and the US government.
